

# AUB- Abnormal Uterine Bleeding

Minerva's minimally invasive devices help physicians target the **causes of AUB**, rather than medicate the symptoms or remove the organ altogether. Each treatment is minimally invasive and, in many cases, is performed in the physician's office.

**Minerva's treatments are minimally invasive, modern and safe.**

Engineered to elevate the experience for you and your physician. Designed to improve upon all those devices that came before. **Each treatment is hormone-free and preserves the uterus.**

**Minerva's devices treat the three most common causes of AUB**

# Treatments for the Endometrium

## Minerva ES® Endometrial Ablation System

The most effective endometrial ablation treatment in the history of clinical trials conducted for FDA approval.<sup>1</sup>

Endometrial ablation is a one-time treatment that is effective at reducing or eliminating **bleeding and clots due to AUB-E**. The treatment involves a minimally invasive method of removing the uterine lining. This is the layer that sheds during your period.

**Designed by the same team that developed NovaSure in the 1990s, Minerva ES was judged to be statistically significantly more effective<sup>1</sup>, in 2015, when the FDA compared Minerva ES to a group of product treatments that included NovaSure® and 4 other previously FDA approved products.**
